

Bottlenecks, Not Narratives: Highest-Growth Sectors, 2026–2036, and How the Whales Are Already Positioned

AI demand hits physical scarcity — chips, power, grids — plus defence, GLP-1s, India, and the credit that finances the build.

List of figures

Figure 1. Semiconductor revenue, 2025–2027F (Gartner Aug 2026 via Semiconductor Digest).

Figure 2. AI data-centre share of chip sales, 2026 vs 2030 (Gartner).

Figure 3. Data-centre electricity, 2025–2030, with 2035 range (IEA).

Figure 4. World military spend vs NATO Europe/Canada pace (SIPRI; NATO).

Figure 5. GLP-1 2030 TAM revisions — sell-side estimates, not actuals (Reuters).

Figure 6. India FY2026/27 vs world 2026 real GDP growth (IMF July 2026).

Figure 7. Private credit AUM, Mar 2025 vs end-2030 forecast (BlackRock/Prequin).

Figure 8. Complements vs orthogonal bets (schematic).

Figures use only quantities already stated in the 1 September 2026 draft. Sell-side TAMs, forecasts, and secondary 13F aggregators are labelled as such. Unverified items are in the Appendix and are not charted.

1 Abstract and thesis

The next decade's highest-growth investable sectors sit where AI demand hits physical scarcity—chips, memory, data centres, power, grids—plus GLP-1s, defence, and India.

Private credit finances the build-out; it is not a co-equal product market.

Gartner (August 2026) puts semiconductor revenue at ~\$1.56 trillion in 2026 (+92% vs \$809 billion), with AI data centres 36.5% → >53% of chip sales by 2030.

The IEA has data-centre electricity 485 → 950 TWh (2025–2030) and five tech firms' capex >\$400 billion in 2025, +~75% in 2026.

SIPRI records \$2.887 trillion of 2025 military spend; NATO shows Europe/Canada core defence +~20% in 2025 toward 5% of GDP by 2035.

Obesity-drug 2030 TAMs were cut toward \$80–\$114 billion. India remains the IMF's fastest major economy (6.4% FY2026/27; 7.0% calendar 2026).

Private credit is >\$2.2 trillion AUM (March 2025) on a path to ~\$4.5 trillion by 2030 (~13% CAGR).

Whales already own the listed and infra expression. The thesis fails if AI capex reverses without utilisation, if grids and chips stay blocked, or if GLP-1 prices and NATO budgets both mean-revert.

THESIS

Over 2026–2036, growth concentrates where AI demand hits physical bottlenecks (compute/semiconductors and power/grids/nuclear) and where policy or biology compounds independently (defence; GLP-1 obesity care; India's consumption). Whales already own the public-equity and infrastructure versions of those bottlenecks and use private markets and credit for the unlisted remainder. Private credit is a financing sector, not a substitute for the real-economy growth case.

Two definitions, used throughout. TAM (total addressable market) is the revenue a product category could theoretically earn if it served all relevant customers.

CAGR (compound annual growth rate) is the constant yearly rate that takes a starting number to an ending number over n years.

A Form 13F is a quarterly U.S. SEC filing of U.S.-listed equity holdings by managers with more than \$100 million in qualifying AUM; it is a lagging, long-only, U.S.-listed snapshot—not a full portfolio.

This paper ranks six sectors with the strongest evidenced growth case, drops two candidates explicitly, compares how the bets differ, and states what would falsify the thesis.

2 Method and data

As-of date: 1 September 2026.

Primary pages fetched include the IMF July 2026 WEO Update PDF; IEA Electricity 2026 and Key Questions on Energy and AI executive summaries; SIPRI (April 2026); NATO (7 July 2026); Berkshire's 2025 letter (28 February 2026); Microsoft FY2026 Q4 release (29 July 2026).

Also: NBIM 2025 results; GIC FY2025/26 CEO letter; Temasek Review 2026 release (8 July 2026); Brookfield 2026 Outlook PDF; BlackRock's 2026 Midyear Outlook and January 2026 private-credit primer.

Gartner semiconductor figures are from the Semiconductor Digest republication of Gartner's August 2026 table (Gartner.com was bot-walled). Amazon capex is from CNBC's report of the 30 July 2026 call (secondary).

13F XML was not parsed; aggregators are labelled secondary. Missing figures are omitted (Appendix).

Ranking uses evidenced revenue, capex, TAM, or expenditure growth into the early 2030s, plus whale capital split by public equity / private / infrastructure / credit.

3 Ranked sectors

Six sectors, ordered by the strength of the evidenced growth case into the early 2030s—not by 2026 stock performance.

Rank 6 is a financing layer on Ranks 1–2, not a seventh product TAM.

Table 1. Ranked sectors as stacked cards (the five-column table is too wide for a 5×8 measure). All figures as in the 1 September 2026 draft.

RANK 1

AI compute / semiconductors

KEY 2026–30

\$1,555.2B 2026 revenue (+92% vs \$809.0B 2025); \$1,939.9B 2027F; AI DC share 36.5% → >53% by 2030 (Gartner Aug 2026)

WHALE EXPRESSION

Indexers own the listed stack; Temasek AI sleeve (6% NPV, target 15% by FY2031); Brookfield–NVIDIA up to \$100B AI infra

MAIN RISK

Hyperscaler capex strike; 2026 is a memory-price year, not a decade CAGR

RANK 2

Electricity, grids, nuclear, DC power

KEY 2026–30

DC electricity 485 → 950 TWh (2025–30); 2035 range 700–1,700 TWh (IEA); grid investment needs ~+50% from ~\$400B/yr

WHALE EXPRESSION

Berkshire Hathaway Energy; Brookfield \$100B program + Westinghouse; GIC regulated networks; Temasek core-plus infra

MAIN RISK

Queue times, transformers/turbines; affordability politics; nuclear is slow

RANK 3**Defence and dual-use****KEY 2026–30**

World military spend \$2.887T in 2025 (+2.9% real) (SIPRI); NATO Europe/Canada core +~20% in 2025 toward 5% of GDP by 2035

WHALE EXPRESSION

Index primes (no Lockheed/Rheinmetall 13F weights quoted); Berkshire Precision Castparts is aerospace supply chain, not a defence ETF

MAIN RISK

Peace/fiscal mean-reversion; execution; 2025 global pace was the slowest since 2021

RANK 4**Biopharma: GLP-1 / obesity****KEY 2026–30**

2030 TAMs cut: old ~\$150B; Jefferies ~\$80B; Goldman ~\$105B then ~\$114B; many 2030s cluster ~\$100B (Reuters 2 Feb 2026) — sell-side, not actuals

WHALE EXPRESSION

Novo and Lilly via global indices (NBIM's 7,201 listed names). No 2026 LLY/NVO 13F weights quoted

MAIN RISK

U.S. price erosion already visible; compounding; reimbursement politics

RANK 5**India (not “EM” as a bloc)****KEY 2026–30**

India 6.4% FY2026/27 (calendar 7.0%) vs world 3.0% / 3.4% (IMF July 2026)

WHALE EXPRESSION

Temasek names India as a market of scale; GIC publishes no India weight in the fetched letter; Berkshire letter is U.S. and Japan

MAIN RISK

Energy-price and conflict spillovers; monsoon/fiscal/rupee (Temasek noted 13.2% SGD/INR in FY2026)

RANK 6**Private credit (financing layer)****KEY 2026–30**

>\$2.2T AUM Mar 2025 → ~\$4.5T end-2030 (~13% CAGR) (BlackRock/Preqin); ~54% direct lending

WHALE EXPRESSION

Temasek private credit 2% NPV, target 5% by FY2031 (Aranda > S\$13B); BlackRock AI-buildout sleeve; NBIM is 26.5% public bonds, not a BDC

MAIN RISK

NAV/evergreen liquidity mismatch; specialised AI collateral; AUM can outrun economic value added

3.1 Rank 1 — AI compute and semiconductors**Why**

This is the only sector with a near-term revenue explosion and a structural mix shift that lasts into 2030.

Gartner’s August 2026 forecast puts worldwide semiconductor revenue at \$1,555.2 billion in 2026 (92% above \$809.0 billion in 2025) and \$1,939.9 billion in 2027.

Memory is \$837.3 billion of 2026 revenue (54% of the market, up from 27% in 2025); DRAM revenue is forecast +246.6% and NAND +371.9% in 2026. Non-memory still grows 21.9% to \$717.9 billion in 2026.

The AI data-centre ecosystem is expected to rise from 36.5% of semiconductor revenue in 2026 to more than 53% by 2030 (Gartner 2026).

That mix shift is the decade thesis: even if the 2026 memory price cycle fades, AI servers raise content per rack (HBM, networking, power management, optics).

Figure 1. Worldwide semiconductor revenue, Gartner August 2026 (via Semiconductor Digest). 2026–27 are forecasts.

Demand shows up in hyperscaler P&Ls. Microsoft FY2026 revenue was \$331.8 billion (+18%); Azure +43% in the June quarter; Microsoft Cloud \$59.3 billion (+27%); commercial remaining performance obligation \$678 billion (+84%) (Microsoft 2026).

Amazon guided about \$220 billion of 2026 cash capex, with AWS +37% to \$42.2 billion and backlog \$496 billion; Jassy said even that would not meet 2026 demand and that the squeeze likely lasts into 2027 (CNBC 2026).

The IEA: five tech companies' capex exceeded \$400 billion in 2025 and should jump ~75% in 2026—larger than global oil-and-gas production investment; AI-focused data-centre electricity +50% in 2025 (IEA 2026).

IMF staff note Q1 2026 growth surprises concentrated in AI-hardware exporters (Korea, Taiwan, Thailand, Malaysia) despite a Middle East energy shock (IMF July 2026).

Figure 2. AI data-centre share of semiconductor revenue. Gartner 2026; 2030 is "more than 53%" (lower bound).

Risks

(i) A capex strike: if cloud utilisation and AI revenue lag depreciation of short-lived GPUs, boards cut spend. Microsoft itself noted roughly two-thirds of recent capex in short-lived assets (CPUs/GPUs) on its FY26 Q4 call (Microsoft IR 2026, secondary to the press release).

Amazon's trailing-twelve-month free cash flow was a \$7.6 billion outflow versus an \$18.2 billion inflow a year earlier (CNBC 2026).

(ii) Memory is cyclical: 92% industry growth in 2026 is not a 92% decade CAGR; Gartner's own non-memory path is the better "through-cycle" number.

(iii) Export controls, HBM shortages, and Taiwan/Korea concentration. The IEA flags an HBM shortage expected through at least end-2027 (IEA 2026).

(iv) Valuation risk: the IMF warns that a downward revision to AI profitability could reprice concentrated equity markets (IMF July 2026).

Whales

Public equity. Indexers hold the AI stack because it is the U.S. market. Secondary Q2 2026 13F aggregators (period ended 30 June 2026) list Nvidia as BlackRock Inc.'s largest disclosed U.S.-listed holding, with Microsoft, Amazon, Alphabet, and Broadcom also top-tier (not parsed from EDGAR; Filings Flow 2026).

NBIM: NOK 21,268 billion, 71.3% equities, equity return 19.3%; Tangen cited technology as a driver (NBIM 2026). Berkshire year-end Apple 1.6% (\$62.0 billion) and a core of Apple, Amex, Coke, Moody's—no Nvidia line (Berkshire 2026).

Private. Temasek AI exposure 6% of NPV, target up to 15% by FY2031, across energy/data centres, semis, cloud, models, apps; FY2026 buys included Anthropic and OpenAI (Temasek 2026).

GIC: “early conviction in hyperscalers and core AI infrastructure” and semiconductor bottlenecks (GIC 2026). Sequoia, a16z, Thrive, Tiger, Coatue: no 2026 holdings verified.

Infra / credit. Brookfield's Nov 2025 program with NVIDIA and KIA: acquire up to \$100 billion of AI

infrastructure (Brookfield 2025). BlackRock: overweight U.S. equities, then scarcity—power, memory, chips, data centres—across public/private and debt/equity (BlackRock BII 2026).

3.2 Rank 2 — Electricity, grids, nuclear, and data-centre power

Why

Compute without electrons is inventory.

IEA Electricity 2026: global electricity demand +3.6% a year over 2026–2030 (50% faster than the prior decade); electricity grows $\geq 2.5\times$ overall energy demand through 2030.

U.S. demand +2.1% in 2025 and $\sim 2\%$ a year through 2030, about half from data centres. More than 2,500 GW of projects sit in grid queues.

Meeting 2030 demand would require annual grid investment up $\sim 50\%$ from today's $\sim \$400$ billion. Renewables $+ \sim 1,000$ TWh a year through 2030 ($\sim 8\%/yr$); solar+wind 17% $\rightarrow$ 27% of generation; renewables plus nuclear $\approx$ half of generation by 2030.

Nuclear set a 2025 record; China is $\sim 40\%$ of the nuclear increment; first SMRs around 2030 (IEA Electricity 2026).

Energy-and-AI update: data-centre electricity 485 $\rightarrow$ 950 TWh (2025–2030) ($\sim 3\%$ of global demand); AI-focused load triples; 2035 range 700–1,700 TWh; gas-turbine orders +70% in 2025; 15–27 GW onsite gas for DCs by 2030, mostly U.S. (IEA 2026).

Brookfield cites BNEF U.S. DC power 106 GW by 2035 and grid spend needing to exceed \$600 billion a year by 2030 (Brookfield 2026). This is contracted-capex growth, which is why infra whales prefer it to “AI software.”

Figure 3. Data-centre electricity, IEA 2026. 2035 marker is the midpoint of the published 700–1,700 TWh range, not an IEA central case.

Risks

Queue times and transformer/turbine shortages can cap near-term realised growth even as TAM looks huge (IEA: bottlenecks reduce odds of aggressive near-term DC-power scenarios).

Affordability politics: data centres can raise local prices if cost allocation is sloppy (IEA). Wildfire liability and the regulatory compact can freeze utility investment (Berkshire/BHE).

Nuclear remains slow, capital-intensive, and political. IEA share-price work finds no generalised energy-sector re-rating from AI—only turbines, electrical equipment, some nuclear, and startups (IEA 2026).

Whales

Operating / infra. Abel: BHE is in a significant investment cycle from AI computing and Western wildfire risk; hyperscalers pay their own infra; 2025 BHE operating cash flow \$8.4 billion; Berkshire cash/Treasuries > \$370 billion (Berkshire 2026).

Brookfield: \$100 billion AI-infrastructure program, Westinghouse nuclear, “any-and-all” generation; hyperscaler contracting doubled in <2 years (Brookfield 2025–26).

SWFs / listed. GIC: regulated networks, grid-efficiency, power equipment (GIC 2026). Temasek: core-plus infrastructure 1% of NPV, target 5% by FY2031; FY2026 S\$5 billion Sustainable Living; STT GDC sold to KKR and Singtel for S\$6.6 billion (Temasek 2026).

NBIM: 0.4% unlisted renewables, +18.1% in 2025—tiny, mandate-capped (NBIM 2026). Credit. Project-finance-like DC debt with contracted offtake (BlackRock BII 2026; Brookfield 2026).

3.3 Rank 3 — Defence and dual-use

Why

Defence is budgeted by states.

SIPRI: world military expenditure \$2,887 billion in 2025, +2.9% real, 11th consecutive year, +41% over 2016–25; burden 2.5% of world GDP; spend ex-U.S. +9.2% as Europe and Asia offset a U.S. dip (SIPRI 2026).

NATO (7 July 2026): European Allies and Canada raised core defence spend nearly 20% in 2025; in 2026 five Allies already meet 3.5% of GDP core and 17 the 1.5% security-investment guideline—ahead of the 2035 Hague deadline of 5% of GDP (3.5% core + 1.5% resilience/innovation) (NATO 2026).

Secondary reports put 2026 alliance spend above \$1.8 trillion vs ~\$1.63 trillion in 2025 (Anadolu Agency 2026). Dual-use overlap with AI is qualitative; no dual-use TAM is invented here.

Figure 4. Two panels, two units: SIPRI world level (\$T) versus one-year percentage changes (SIPRI world real vs NATO Europe/Canada core). Do not compare bar heights across panels.

Risks

A peace/fiscal mean-reversion; U.S. budget politics; execution (Europe cannot spend 5% of GDP on deliverable munitions overnight); export controls; crowding-out of civilian capex (IMF April 2026 WEO discussion of military spend vs productive uses).

2025’s +2.9% global real growth was the slowest since 2021—the level is high; the acceleration is Europe-specific.

Whales

Indexers own listed primes via benchmarks; no Lockheed/Rheinmetall 13F weights are quoted. PIF's strategy page was blocked; dollar claims omitted.

GIC treats geopolitics as structural (GIC 2026)—a worldview, not a missiles book. Berkshire's Precision Castparts (\$2.4 billion 2025 operating cash flow) is aerospace supply-chain exposure, not a defence ETF (Berkshire 2026).

3.4 Rank 4 — Biopharma: obesity / GLP-1 (and adjacent metabolic aging)

Why

GLP-1s are still a once-in-a-generation pharma category, but 2026 TAM estimates were revised down on U.S. price cuts.

Reuters (2 February 2026): the old \$150 billion early-2030s obesity figure looks less certain; many 2030 forecasts sit around \$100 billion. Jefferies cut its peak to ~\$80 billion.

Goldman was cited at \$105 billion for 2030 (from \$130 billion); later secondary Goldman notes say \$114 billion—same house, different vintage, both sell-side (Reuters 2026).

The surviving case: sales still scale into tens or hundreds of billions of dollars, orals widen access, and Lilly/Novo remain the duopoly unless a third winner appears. High growth, more contested than chips or grids.

Figure 5. Sell-side / TAM estimates of the obesity-drug market — not realised sales. Reuters, 2 February 2026 (Jefferies; Goldman vintages).

Risks

Price erosion (already visible), compounding, oral cannibalisation of injectables, reimbursement politics, safety headlines, and China/compounding supply.

Aging/longevity beyond GLP-1 is mostly a narrative in this draft—no verified 2030 TAM was fetched.

Whales

Novo and Lilly sit in global indices (NBIM’s 7,201 listed names). No 2026 LLY/NVO 13F weights are quoted.

Temasek's 8 July 2026 release emphasises AI, infra, and credit, not a GLP-1 sleeve (Temasek 2026).

3.5 Rank 5 — India (and selected EM consumption), not “EM” as a bloc

Why

IMF July 2026: world 3.0% (2026) / 3.4% (2027); EMDEs 3.8% then 4.5%; India 6.4% FY2026/27 and 6.7% FY2027/28 (7.0% / 6.4% calendar)—still among the fastest-growing major economies, on consumption and services (IMF 2026).

China 4.6% / 4.1%. Vietnam 7.5% (2026) is faster but smaller.

IEA: emerging economies ~80% of extra electricity through 2030; India's share rises; China still ~50% of the global increment (IEA 2026).

India is a GDP compound, not a 92% chip year. Over a decade, 6%+ real growth in a large economy still beats most theme TAMs for consumption, financials, and domestic infra.

Figure 6. IMF July 2026: India FY2026/27 versus world calendar 2026. Fiscal versus calendar year — not a like-for-like quarterly print.

Risks

IMF flags energy-price and conflict spillovers, tariffs, and that economies off the tech value chain underperform.

India-specific: monsoon/food inflation, fiscal arithmetic, rupee (Temasek noted a 13.2% SGD/INR move in FY2026), and private-market valuations.

Whales

Temasek's CIO names U.S., Europe, China, and India as markets of scale; TGI exited Schneider Electric India after a long hold (Temasek 2026). Named India consumer stakes in secondary interviews are not in the 8 July NPV release.

GIC publishes no India weight in the fetched letter. NBIM is an indexer (India = benchmark residual). Berkshire's letter is U.S. and Japan; no India opco.

3.6 Rank 6 — Private credit (the financing layer)

Why

BlackRock's January 2026 primer (Preqin + Cliffwater): private credit > \$2.2 trillion AUM (March 2025), ~14% of a \$15.9 trillion alts universe, 2× 2018 and 4× 2014.

Forecast \$4.5 trillion by end-2030, ~13% CAGR (vs 16% in 2020–24) (BlackRock 2026). Direct lending is ~54% of that Preqin cut.

IMF GFSR oral remarks (April 2026, secondary): direct lending ~\$2 trillion; ~15% / \$300 billion semi-liquid; defaults ~2–3% baseline, 4–6% adverse; systemic risk contained if gates hold.

Drivers: bank-capital retreat, longer private lives, AI/data-centre project finance, ABF, insurers.

Figure 7. Private credit AUM, BlackRock January 2026 primer (Preqin + Cliffwater). March 2025 is a stock; 2030 is a forecast.

Risks

Spread compression, manager dispersion, NAV/evergreen liquidity mismatch, correlation with PE exits, and AI-collateral (GPUs, data centres) that is specialised.

This is AUM growth, which can run ahead of economic value added if fees and leverage do the compounding.

Whales

Temasek: private credit 2% of NPV, target 5% by FY2031; Aranda > S\$13 billion, > S\$1 billion income (Temasek 2026). BlackRock's outlook treats private credit as a core AI-buildout sleeve (BII 2026).

Brookfield cites a \$7 trillion AI-value-chain infra need (Brookfield/IDC, not IEA) as a debt opportunity (Brookfield 2026). NBIM is 26.5% public bonds, not a BDC. Berkshire's \$176 billion float is insurance.

4 How the bets compare

Bets (1) and (2) are complements: chips pull power; grids gate chips. Defence is orthogonal (geopolitics), except shared chips/cyber/cloud.

GLP-1 is orthogonal (biology/price). India is a geography overlay. Private credit schedules and levers (1)–(2).

Public vs private vs infra vs credit. Hyperscalers and Nvidia are the public-equity expression of (1). BHE, Brookfield, GIC utilities, Temasek core-plus, and NBIM's tiny unlisted renewables are the infra expression of (2).

Defence and GLP-1 remain mostly listed. India and foundation models are more private. The AI factory is increasingly project credit + infra equity because balance-sheet capex is no longer enough (IEA 2026).

Figure 8. Complements vs orthogonal bets. Schematic mapping of Section 4 — no additional quantities.

5 Falsification

The thesis needs a rewrite if several of these occur together (one is a warning; the cluster is fatal):

1. Hyperscaler 2026/27 capex is cut in dollars and cloud RPO/backlog normalises—Microsoft \$678 billion RPO and Amazon \$496 billion AWS backlog are the 2026 tells (Microsoft 2026; CNBC 2026).
2. IEA data-centre electricity stalls well below ~950 TWh in 2030 because queues never clear, or efficiency outruns new energy-intensive uses.
3. Semiconductor revenue returns to the old cycle and AI data centres fail to approach ~50% of chip revenue by 2030.
4. NATO Europe misses the Hague path after 2025's 20% jump and U.S. real outlays fall for years.
5. Obesity-drug 2030 sales cluster below ~\$80 billion with no volume offset.
6. India loses 6%+ major-economy growth for years with no replacement EM compound.
7. Private-credit AUM stops compounding as losses eat the yield pickup and AI-infra project finance reprices as stranded.

A failed LLM vendor does not falsify the thesis. You do not need to know which model wins to know AI needs power, memory, chips, and data centres (BlackRock BII 2026). A failed grid, HBM chain, or GPU ROI does.

6 Conclusion

As of 1 September 2026 the ranking is: (1) AI compute/semiconductors, (2) electricity-grids-nuclear, (3) defence, (4) GLP-1, (5) India consumption, (6) private

credit as finance.

Robotics is real but not in this league (Interact Analysis 6.7% industrial-robot shipments CAGR 2025–30; IFR preliminary +15% to 621,000 units in 2025).

Climate adaptation is a needs gap (UNEP AGR 2025: \$310–365 billion/year by 2035 vs \$26 billion public flows in 2023), not a whale growth market; the investable climate piece sits inside grids, renewables, and nuclear.

Whales are not waiting for a 2030 slide. Hyperscalers spend. Indexers own the listed stack. Brookfield, GIC, Temasek, and Berkshire Energy own the physical assets. BlackRock and Temasek write the credit.

The scarce objects are megawatts, HBM, and contracted cash flow.

THESIS

The scarce objects are megawatts, HBM, and contracted cash flow—not a winning foundation-model brand.
